0000 51 : Facility: System bootstrapping and initialization
0000 52 :
0000 53 : Abstract: This module contains initialization routines that are loaded
0000 54 :           during system initialization (rather than linked into the system).
0000 55 :
0000 56 : Environment: Mode = KERNEL, Executing on INTERRUPT stack, IPL=31
0000 57 :
0000 58 : Author:  Trudy C. Matthews           Creation date: 22-Jan-1981
0000 59 :
0000 60 : Modification history:
0000 61 :
0000 62 :           V04-002 TCM0013           Trudy C. Matthews           10-Sep-1984
0000 63 :           Add $BQODEF missing from TCM0012.
0000 64 :
0000 65 :           V04-001 TCM0012           Trudy C. Matthews           07-Sep-1984
0000 66 :           For venus processor: turn on cache before calibrating
0000 67 :           TIMEDWAIT cells (routine EX$INI_TIMWAIT). Store the TIMEDWAIT
0000 68 :           values calculated after cache is enabled in the boot driver's
0000 69 :           TIMEDWAIT cells. This is because the boot driver initially
0000 70 :           has to run with cache off, but after booting will run with
0000 71 :           cache on.
0000 72 :
0000 73 :           V03-024 TCM0011           Trudy C. Matthews           31-Jul-1984
0000 74 :           Change venus's CRD interrupt vector back to ^X54 in the SCB.

0000	91	:	On a MicroVAX I, if the sysgen parameter TIMEDWAIT is set
0000	92	:	to request no time-prompting, then use the last recorded
0000	93	:	system time instead. This is found in EXESGQ_TODCBASE
0000	94	:	which can be updated with a SET TIME command.
0000	95	:	
0000	96	:	V03-019 RLRSCORPIO Robert L. Rappaport 16-Mar-1984
0000	97	:	Begin additions (to INISIOMAP) for Scorpio support.
0000	98	:	Also move ADAPDESC to SYSMAR.MAR, changing it to remove
0000	99	:	the ADAP_GENERAL array.
0000	100	:	
0000	101	:	V03-018 RLRINIADP Robert Rappaport 28-Feb-1984
0000	102	:	Add refinements to previous update that introduces
0000	103	:	longword array CONFREG. Mainly add logic to allow for
0000	104	:	independently assembled invocations of ADAPDESC macro
0000	105	:	to be linked into this code. This provides possible
0000	106	:	support of BI as a public bus, with user defined nodes.
0000	107	:	
0000	108	:	V03-017 KPL0100 Peter Lieberwirth 30-Jan-1984
0000	109	:	Implement first step towards a longword-array CONFREG to
0000	110	:	replace current byte array CONFREG. INIADP will construct
0000	111	:	two confregs, CONFREG and CONFREGL. CONFREGL will be
0000	112	:	a longword array. The high byte will be a VMS-bus
0000	113	:	designation, and the low word will contain the 16-bit
0000	114	:	device type. The BI introduces 16 bit device types.
0000	115	:	
0000	116	:	When all references to CONFREG have been modified to touch
0000	117	:	CONFREGL, INIADP will be modified again to stop creating
0000	118	:	the byte array.
0000	119	:	
0000	120	:	While here, map 9 pages of CI register space, up from 8.
0000	121	:	
0000	122	:	V03-016 KPL0001 Peter Lieberwirth 17-Jan-1984
0000	123	:	Fix bug in V03-015 that caused a failure to boot on 750s.
0000	124	:	Specifically, add NDT\$_MEM1664NI to ADAPDESC macro.
0000	125	:	
0000	126	:	V03-015 TCM0009 Trudy C. Matthews 12-Dec-1983
0000	127	:	Add support for booting from VENUS console device to
0000	128	:	INISCONSOLE. When mapping I/O space on VENUS, use the
0000	129	:	PAMM to determine if any adaptors are present on the
0000	130	:	ABUS.

0000 254 .SBTTL Macros to describe nexus configurations
0000 255
0000 256 The macros FLOAT_NEXUS and FIXED_NEXUS add one or more entries to a
0000 257 nexus descriptor table. Each entry is of the form:
0000 258
0000 259 +-----+
0000 260 | PFN of nexus I/O space |
0000 261 +-----+
0000 262 | bus | 0 | type |
0000 263 +-----+
0000 264 type = 0 -> floating nexus
0000 265 type = non-zero -> fixed nexus; type = fixed adapter type
0000 266 bus = 0, if SBI; %x80 if BI (this is a VMS-only designation)
0000 267
0000 268 device_type: SBI adapters have 8-bit device type codes. These
0000 269 device types are simple integers.
0000 270
0000 271 BI adapters have 16-bit device type codes, that are
0000 272 subject to the following interpretation:
0000 273
0000 274 - the MSB of the device-type field will be 0 for DEC
0000 275 devices and 1 for non-DEC devices,
0000 276
0000 277 - DEC memory devices will have 0s in the high-order
0000 278 byte of the device type,
0000 279
0000 280 - non-DEC supplied memory devices will have a 1 in the
0000 281 MSB of the high-order byte, and the rest of the high
0000 282 order byte will contain 0s.
0000 283
0000 284 - The "all 0s" and "all 1s" device-type codes are
0000 285 reserved for DEC.
0000 286
0000 287 If SBI type codes were simply expanded to a word for purposes of the routines
0000 288 in this module, there would be possible conflicts between SBI devices and
0000 289 BI memory adapters supplied by DEC. Voila: the bus type.

0289 734 .SBTTL INISMAP, Initialize and map nexuses
0289 735 :++
0289 736 : FUNCTIONAL DESCRIPTION:
0289 737 : This routine is executed only once, during system initialization.
0289 738 : It loops through all nexuses on the system, testing for
0289 739 : adapters. When it finds an adapter, it maps its I/O space and
0289 740 : initializes it.
0289 741 :
0289 742 : INPUTS:
0289 743 : BOO$GL_SPTFREL - next free VPN
0289 744 : MMG$GL_SPTVASE - base of system page table
0289 745 : EXE$GL_RPB - address of reboot parameter block
0289 749 :
0289 750 : OUTPUTS:
0289 751 : R0 - $$$_NORMAL
0289 752 :
0289 753 : For each adapter found, its accessible I/O space is mapped to virtual
0289 754 : addresses. An ADP (Adapter Control Block) is built, and the hardware
0289 755 : adapter is initialized.
0289 756 :
0289 757 : The arrays CONFREG (a byte array of nexus-device type codes, defined
0289 758 : by NDT$ symbols) and SBICONF (a longword array of
0289 759 : virtual addresses that map adapter space) are initialized. Pointers
0289 760 : to these arrays are stored in EXE$GL_CONFREG and
0289 761 : MMG$GL_SBICONF. The number of entries in these two parallel arrays is
0289 762 : stored in EXE$GL_NUMNEXUS.
0289 763 :
0289 764 : Since BI devices have a 16-bit device type code, a new CONFREG array is
0289 765 : constructed. This is a longword array called CONFREGL.
0289 766 :
0289 767 : Several locations in the RPB that describe the boot device are init'ed:
0289 768 : RPB$B_BOOTR1 - holds index into CONFREG and SBICONF for the boot
0289 769 : adapter
0289 770 : RPB$B_ADPVIR - holds VA of boot device adapter's register space
0289 771 : RPB$B_CSRVIR - holds VA of boot device's register space

02CC 2141 .SBTTL EXESINI_TIMWAIT - COMPUTE CORRECT TIMEWAIT LOOP VALUES
02CC 2142 :++
02CC 2143 : FUNCTIONAL DESCRIPTION:
02CC 2144 :
02CC 2145 : EXESINI_TIMWAIT initializes EXESGL_TENUSEC and EXESGL_UBDELAY, cells used
02CC 2146 : in the time-wait macros. The first data cell, EXESGL_TENUSEC, is the number
02CC 2147 : of times the following loop will be executed in ten u-seconds. This is
02CC 2148 : done once here to calibrate the loop instead of reading the processor clock.
02CC 2149 : The resulting number is used in the system macros TIMEWAIT and TIMEDWAIT.
02CC 2150 :
02CC 2151 : The first step is to initialize EXESGL_UBDELAY. If the bit test instruction
02CC 2152 : in the TIMEWAIT macro is executed too rapidly in a loop, it can saturate the
02CC 2153 : Unibus. EXESGL_UBDELAY is used to introduce a 3 microsecond delay loop into
02CC 2154 : the TIMEWAIT bit test loop.

02DB 2299 .SBTTL EXESINIT_TODR - SET SYSTEM TIME TO CORRECT VALUE AT STARTUP
02DB 2300 :++
02DB 2301 : FUNCTIONAL DESCRIPTION:
02DB 2302 :
